Release notes

This document provides the new features, installation and upgrade notes, bug fixes, known issues, and workarounds that apply to release 26.4.0 of OpenText™ Fortify SAST.

This information is not included elsewhere in the product documentation. User guides for this product are available on the [Product Documentation](#) website:

1. Product name changes

OpenText is in the process of changing the following product names:

Product name changes

Previous name	New Name
OpenText™ Static Application Security Testing (OpenText SAST)	OpenText™ Fortify SAST
Fortify Software Security Center	OpenText™ Application Security
Fortify WebInspect	OpenText™ Dynamic Application Security Testing (OpenText Fortify DAST)
OpenText™ Core Application Security	OpenText™ Fortify on Demand
OpenText™ Core Software Composition Analysis (OpenText Core SCA)	OpenText™ Fortify Software Composition Analysis (OpenText Fortify SCA)
OpenText™ Application Security Aviator	OpenText™ Fortify Remediation Aviator
Fortify Applications and Tools	OpenText™ Application Security Tools

The product names have changed on product splash pages, mastheads, login pages, and other places where the product is identified. The name changes are intended to clarify product functionality and to better align the Fortify Software products with OpenText. In some cases, such as on the documentation title page, the old name might temporarily be included in parenthesis. You can expect to see more changes in future product releases.

2. Fortify documentation updates

The following documents will reflect changes that enable us to release products more often and with fewer dependencies on other products in the Application Security (Fortify) suite.

Document	Change
OpenText™ Application Security Software Release Notes	This document has been renamed to OpenText™ <Product Name> Release Notes as each product will have its own release notes document.
Application Security Software System Requirements	Rather than publishing a single guide that covers all of the products for a specific release, each product's requirements can be found in the product's user guide.
What's New in Application Security Software	New features will no longer appear in a separate document. New features will be listed in the product's Release Notes.

3. What's new

This section summarizes the updates introduced in this release, including new features and enhancements, changes to supported platforms, languages, build tools, and compilers.

The following updates have been added to Fortify SAST.

Platform support:

- AlmaLinux 10.x
- SUSE Linux Enterprise server 16
- macOS 26 and 27

Language support

- .Net (Core) 7.x - 11.x (Preview)
- C# 15 (Preview)
- Go 1.27
- Kotlin 2.4
- Swift 6.4
- T-SQL SQL Server 2014, 2016, 2017, 2019, 2022, 2025

Build tool support:

- MSBuild 18.x
- dotnet 11
- xcode 27
- dotnet 7.x - 11.x (Preview)

Compilers:

- gcc 14
- LLVM Clang 21.1.6

Features.

- AI Analyzer now supports configuring database connection properties through environment variables.
- The legacy COBOL analyzer is no longer run by default and must be explicitly enabled by using `-cobol-legacy` option or the `com.fortify.sca.CobolLegacy=true` property.
- Added KornShell as a supported language for AI-powered SAST.
- Added the ability to scan minified JavaScript and TypeScript files during regex analysis by using the `-regex-scan-minified` option or the `com.fortify.sca.regex.ScanMinifiedJS` property.

- Added the property `com.fortify.sca.ai.cache.missOnNewPrompt` to regenerate cached LLM results when a different model is used.

4. Known issues

The following are known problems and limitations in Fortify SAST version 26.4.0:

- Analyzing Terraform, Solidity, and Bicep require downloading dependencies at scan-time if not provided manually. For optimal results, these languages should either be scanned locally or the scan machine should have a network connection to download dependencies.
- Some languages have scan-time dependencies that may make use across all platforms infeasible. This may have an effect when considering mobile build sessions or ScanCentral SAST sensors. Scan-time dependencies are listed in the product's System requirements page.
- Some source files might be missing from the scan of an Xcode project if all targets in the project are not built for the same set of target architectures.

Workaround: If you encounter this problem, specify a single architecture for the build by adding the `-arch` option to the `xcodebuild` command that will be run by `sourceanalyzer`. You can also update the build configuration in the Xcode project or create a separate configuration to use for scanning and ensure that the target architecture(s) is the same for all targets.

5. Compatibility changes and deprecations

This section describes features, platforms, languages, and other capabilities that are deprecated, obsolete, or no longer supported in this release.

Platform support:

- macOS 15, 26.3, 26.4
- macOS CPU arch x64

Language support:

- .Net (Core) 5.x, 6.x
- .Net Framework 4.6
- Java (with Android) 7
- T-SQL SQL Server 2005, 2008, 2012

Build tool support:

- Maven 3.8.x
- xcode 16.x
- Bazel 6.x

Compilers:

- gcc 13
- LLVM Clang 17.0.6

Tool

- The `fortifyclient cli` tool has been deprecated. It is recommended that you use `fcli` as the supported replacement. For more information, see <https://github.com/fortify/fcli>.
- The Intel-based macOS installer is deprecated. The M-series (ARM) based installer will continue to be made available.

6. Support and documentation

When contacting Customer Support, provide the following product information:

Software Version: 26.4.0

Software Release Date: October 2026

Contacting Customer Support

Visit the [Customer Support](#) website to:

- Manage licenses and entitlements
- Create and manage technical assistance requests
- Browse documentation and knowledge articles

Product feature videos

You can find videos that highlight OpenText Application Security Software products and features on the [Fortify Unplugged YouTube™ channel](#).

7. Definitions

DEPRECATION

When a product feature or integration is deprecated, OpenText no longer accepts enhancement requests for the feature but does respond to critical or security defects. OpenText will continue to support the usage of a deprecated feature or integration. If applicable, the feature is turned off by default, but customers can re-enable it. OpenText will stop supporting the feature or integration on the removal date or in the removal release.

REMOVAL

When a product feature or integration is removed, OpenText no longer accepts or responds to critical or security defects. If the feature is a function, coded in the product, all code is removed, and the feature no longer functions in the product. If the feature is an external system or integration, the ability to integrate or be used by the product is removed and OpenText no longer supports its use or ability to function.
